## In-Class Test #1 - Module Numerical Methods Engineering Mathematics for Advanced Studies IIT Dharwad Autumn 2019

Time - 20 minutes

Maximum score -  $20\,$ 

Rule for absentee - Minimum 30% penalty, discuss reasons absense in person to get a chance for re-test.

Date - 14th Nov. 2019

- 1. Free run out condition on the cubic spline means:
  - (a) Slopes on both ends are zero
  - (b) Curvature Second derivative of curve at both ends are zero
  - (c) Curvature Second derivative of curve at both end nodes equals the respective values at neighboring node

(mark 2)

(d) Slope at both end nodes equals the respective values at neighboring node

ANSWER: \_\_\_\_\_

2. A student ABC uses following criteria to stop numerical iterations:

 $error = (x_{new} - x_{prev})$ if  $error \leq tolerance$ exit

Another student XYZ uses  $\begin{array}{l} error = (\frac{x_{new} - x_{prev}}{x_{new}}) \\ \text{if } error \leqslant tolerance \\ \text{exit} \end{array}$ 

Which one is more appropriate approach to ensure u	versatality of the subroutine across dif-
ferent applications - ABC's or XYZ's?	(mark 1)

	Whi	ch practical <del>ly</del> precaution is necessary for XYZ's <del>appropriate</del> approach?	(mark 2)
3.	True	e or False	
	(a)	Global error of the Trapezoidal method is of the smaller order than the order of local error of the same method	(mark 1)
	(b)	Simpson's rule belongs to Newton-Cotes category however Gauss quadrature is not Newton-Cote's formula	(mark 1)
	(c)	Langrange interpolation is a polynomial interpolation	(mark 1)
	(d)	Numerical finite difference scheme is unconditionally stable for Elliptical PDE	(mark 1)

(e)	) Numerical finite difference scheme is unconditionally stable for Parabolic PDE	(mark 1)
(f)	) Higher order differential equation can be solved using appropriate choice of Euler method	(mark 1)
(g)	method	(mark 1)
inte	nstructor gets equally spaced 11 points from equation $y = 2x^2 - 4x + 2$ and poses the numerical egration problem to students. Student ABC integrates using the Simpson's Rule while the XYZ s Trapezoidal rule (Choose all correct answers)	(mark 2)
(a) (b) (c) (d) (e)	<ul> <li>) XYZ's answer will match analytical value of the integration (ignore round-off errors)</li> <li>) Both ABC and XYZ will have some error, but ABC's error would be smaller that XYZ's error</li> <li>) Both ABC and XYZ will have some error, but ABC's error would be larger that XYZ's error</li> </ul>	
	solving system of linear equations $Ax = b$ , given the inverse $A^{-1}$ is readily available, state how ny operations would be required to get x for a given b?	$(mark \ 2)$
	wen that variable x can be have numerical error bounded by $\beta_x$ and y can be have numerical or bounded by $\beta_y$ , what will be the absolute error bound for $z = x + y$	$(mark \ 2)$
	one reduces the step size by half, the numerical scheme which has error of the order 3 $\mathcal{O}(h^3)$ , and have how much improvement/reduction change in its accuracy ?	(marks 2)
